

Introduction to Research Methods

Practical aspects of ethics in science

Author: Paweł Mendroch

The assignment I've chosen is:

"Present critical overview of 4 most popular (in your opinion) software licenses, conclude with a set of recommendations explaining when one should use a given license."

In my opinion, 4 most popular software licenses are (in no particular order):

1. MIT License

A very short and simple permissive license with almost no conditions, except for the requirement of copyright and license notices. It has high license compatibility, since it can be re-licensed under other licenses. This license also allows reusing within closed-source software, if the notices are included.

The license is very popular among the Github community and some notable projects and frameworks use the MIT License.

MIT License's parent - BST License requires crediting the authors, which was excluded in MIT License.

2. GNU GPL 3.0

GNU General Public License is an example of a copyleft license, which allows reusing, sharing and modifying the software, under condition that the rights are preserved in derivative works (or the work is distributed under equivalent license terms). Copyright and license notices must be preserved.

In the past GNU GPL was the most used license in free and open-source software. This license contributed to the success of Linux systems, because this work continues to remain free and helps people worldwide.

In 2007 version 3.0 of the license was released, which addressed problems from the version 2.0.

The license also includes an optional clause: "any later version", which allows the users to choose the original terms or to 'upgrade' the license with time.

3. BSD 3 License

BSD licenses are permissive software licenses, with minimal restrictions. The license requires that the distributions keep the license and copyright notice. The license does not require distribution of the source code.

BSD license started as a license for a Unix-like system - BSD. Nowadays, most widely used is the 3-clause version of the license, also called BSD License 2.0, which allows for unlimited distribution, as long as the notice and disclaimers are maintained.

4. Apache 2.0

Apache License is a permissive software license, that allows using the software for any purpose, distributing it and modifying it, while preserving the copyright and license notice.

Modified works can be distributed under different terms and without source code.

Although the license was written by Apache Software Foundation, it's also widely used by other non-ASF projects.

How to choose the correct license?

Surely, the most popular option for open-source projects is the MIT License, which works great, if you don't mind other people using your code or distributing it, even under different terms (for example .NET Core, Rails).

If you would like your license to remain unchanged, so that the software remains free for everyone GNU GPL might be more suitable for your situation, which is a copyleft type of license and nobody can create a closed-source version (for example: Bash, GIMP).

If the MIT License works great for you, but you would like to be always credited for your work, you might want to consider using the BSD License.

Apache License gives rights to patent use, which for example MIT License doesn't state, although it does not grant trademark use.
